DECLARATION BY THE CANDIDATES

We, **Ritik Sareen (18011M3504)**, **Vaidya Sai Teja (18011M3509)** hereby certify that the project report entitled **“College Buddy E-commerce platform using web development”** carried out under the guidance of **Dr. Hemalatha Eedi**, is submitted. This is a record of bonafide work carried out by us and the results embodied in this project have not been reproduced/ copied from any source and have not been submitted to any other University or Institute for the award of any other degree or diploma.

Ritik Sareen (18011M3504)
Vaidya Sai Teja (18011M3509)

CSE JNTUH University College of
Engineering
Hyderabad

ACKNOWLEDGEMENT

We would like to express sincere thanks to our Supervisor **Dr. Hemalatha Eedi**, Professor of Computer Science and Engineering Department, JNTUH University College of

Engineering for her admirable guidance and inspiration both theoretically and practically and most importantly for the drive to complete the project successfully. Working under such an eminent guide was our privilege.

We owe a debt of gratitude to **Dr. D. Vasumathi** ma'am, Professor & Head of the Department of Computer Science & Engineering, for her kind considerations and encouragement in carrying out this project successfully.

We are grateful to the Project Review Committee members and the Department of Computer Science & Engineering who have helped in successfully completing this project by giving their valuable suggestions and support.

We express thanks to our parents for their love, care, and moral support without which we would have not been able to complete this project. It has been a constant source of inspiration for all our academic endeavours. Last but not the least, we thank the Almighty for making us a part of the world.

Ritik Sareen(18011M3504)
Vaidya Sai Teja (18011M3509)

ABSTRACT

At present most of the resources that a student purchases during his under-graduation and post-graduation become useless after a set amount of time during the engineering course, making their resources turn into liability for them. On the other hand, there exist a section of students who require to procure their resources but without paying a hefty amount to buy them new.

Hence a space was identified and can be fulfilled by creating a Web application that will not only provide a platform for the sellers to list out the non-essential resources but also provide a platform for the buyers to connect, bargain and procure the same resources but at a much affordable price.

Hence this project “collage buddy” concentrates on creating platform for selling and buying goods such as books, beds, mattresses, utensils and many more resources that a student needs during the course interval.

The most contribution of our proposed system is that it is often used to select the simplest possible options for buying and selling resources, such that the resources are properly utilized. The resource procuring difficulty is reduced because it does not involve any physical searching of the seller.

INTRODUCTION

1.1 Problem Statement

Develop an application which facilitates ease of buying and selling student resources by providing a platform where a seller can post and buyer can search the required resources. [1]A free to use application and also which can be used by any novice user.

(1.1) Objective

1. To evaluate the customer satisfaction of people towards **College Buddy**
2. To identify the advantages and disadvantages of **College Buddy**
3. To identify the attitude of customers towards **College Buddy**
4. To analysis the socio-economic factors

(1.2) Motivation

College Buddy operates as a Local online marketplace for used goods including furniture, Books, Mobiles etc.it is accessible through apps on smartphones.

Proposed System:

To overcome these flaws of the existing system manual system, there is need for a complete web based online system can be developed which can help in proper management, tracking and reporting the solution.

The system is designed to support the following feature.

- Number of users can access the system simultaneously.
- The system provides an interactive screen to the most normal user.
- Increase numbers of reminder were stored in the database in a uniformed manner.
- Allows admin to manage the user and add the user rights.

(1.3) Scope

The study has been carried out to find out the customer satisfaction towards **College Buddy** with a special reference to Students. The study deals with only the people of university. However, the study is concerned to know the reaction of the people who use and to provide awareness to the people by identifying the advantages and disadvantages of **College Buddy**.

SOFTWARE ANALYSIS

2.1. Overall Description

Its objective is to provide a platform for the once who own these resources and who are unable to find a buyer for it thereby making the resource a liability for them.

This system provides an easy solution for customers to browse and buy the different products without going to the shop and to owner to sell the product to customers based anywhere.

This web application will not just be useful for buying and selling of resources but also provides an opportunity for the buyers(juniors) to interact and maintain a healthy relationship with their seniors.

2.2. Overall Description

Its objective is to provide a platform for the once who own these resources and who are unable to find a buyer for it thereby making the resource a liability for them.

This system provides an easy solution for customers to browse and buy the different products without going to the shop and to owner to sell the product to customers based anywhere.

This web application will not just be useful for buying and selling of resources but also provides an opportunity for the buyers(juniors) to interact and maintain a healthy relationship with their seniors.

2.2.1 PERFORMANCE REQUIREMENTS:

- **User Satisfaction:** - The system is such that it stands up to the user expectations.
- **Response Time:** - The response of all the operations is good. This has been made possible by careful programming.
- **Safety and Robustness:** - The system is able to avoid or tackle disastrous action. In other words, it should be foul-proof. The system safeguards against undesired events, without human intervention.
- **Portable:** - The software should not be architecture-specific. It should be easily transferable to other platforms if needed.
- **User-friendliness:** - The system is easy to learn and understand a native user can also use the system effectively, without any difficulties

2.2.2 NON-FUNCTIONAL REQUIREMENTS

All the other requirements which do not form a part of the above specification are categorized as Non-Functional needs. Comfortable network information measures may additionally be a non-functional requirement of a system.

1.Usability:

Regardless of the size of your business, the website of your business should be easy to use for even a non-technical user. Do you know that a general user takes just 0.05 seconds to figure out whether the website is worth its time or not? Thus you have to give special attention to the design of your homepage, CTAs, and easy checkout to get past those milliseconds of doom. The usability of a website is also defined by:

- How easily a user can achieve their target in a single page visit
- How quickly they can perform tasks in the store
- The memorable & intuitiveness of the design
- Number and types of errors users make

2. Security:

Security comes with utmost importance if your site is dealing with monetary transactions, users' financial and sensitive data. Using an SSL certificate and data privacy policy will create trust among the users for your website and convert the customers into brand advocates. It is also considered for the different admin roles by which you can control who can create, see, copy, change or delete information. Depending upon the location of your business, security also refers to compliance with customer data protection rules such as GDPR in Europe.

3.Performance:

For increasing the traffic on your website, you have to give special attention to the performance in the non-functional requirements documentation. The focus should be on loading the e-commerce store as fast as possible regardless of the number of integrations and traffic on your website. You can set up the speed benchmark, maximum SKUs which you want to add, or any other performance

.

Technologies Used

2.3.1. Front – End

- HTML
- CSS
- JAVASCRIPT
- BOOTSTRAP

2.3.2. Platform

- CODE PEN

2.3.3. BACK END

- PHP
- SQL

3.5 PROJECT TESTING:

TESTING:

This section discusses the testing strategy, methodology and types of tests that the product must pass in order to pass quality assurance and customer acceptance. A detailed test plan will be created as part of the implementation phase.

Test Strategy:

The testing strategy used will focus on reliability and performance of the product. This includes the reporting client hardware, software, management software, and overall system integration.

The foundation for the success of this product is the Good Bandwidth.

No matter how reliable the software if the bandwidth is not good the website will not work.

The next key to success is the performance of the website both the reporting user and remote server. Most operations must performance at a sub second performance level. This does not mean that the operation is completed in a sub second although every effort should be done to actually hit the task assign metric rather that the user sees the system respond in some function within a second.

There is no profound medium or system for selling these temporary products for students as customers-consumers commerce environment.

In the busy schedule, students are often not ready to spend their time for purchasing goods from shops. They prefer to purchase goods and services from their home.

3.6 Future Expansion:

1. This system is initially developed for only Institute. But without making any changes in this system it can be expanded for all big Companies.
2. This system is capable of adopting any new feature.
3. This system can be upgraded with new features by making very less changes.
4. The new features that can be added to this system without making vast changes are:
5. Providing news alerts and useful tips to the User regarding New Technology & computer Updates.
6. Computer related any new research can be informed to the User.
7. We are also thinking about to take a bill no or other user side surety to complete that job.

4. IMPLEMENTATION

The implementation is as follows:

1. The frontend is implemented using HTML, CSS, JavaScript where the admin can login to the database.
2. After logging into the website, the admin can perform various operations such as adding entries, dropping database, viewing database and downloading database.
3. While logging in if the credentials are entered incorrectly for 3 consecutive attempts, to logion and process the shopping.
4. After the operations are done, users can exit the database by logging out.

(4.1) languages used

(4.1.1) HTML

There are several packages commonly used in HTML, including:

1. Bootstrap: a popular front-end framework for developing responsive and mobile-first websites
2. jQuery: a fast, small, and feature-rich JavaScript library that makes it easier to work with HTML documents, handle events, create animations, and perform other common JavaScript tasks

3. Font Awesome: a popular icon library that provides scalable vector icons that can be customized (size, colour, drop shadow, etc.) using CSS
4. Animate.css: a cross-browser CSS animation library that makes it easy to add animations to web pages
5. 5. W3. CSS: A CSS framework for building responsive and modern websites.
6. 6. Foundation: a responsive front-end framework
7. These are the commonly used one, but there are many more packages available to suit specific needs.

(4.1.2) CSS

1. CSS (Cascading Style Sheets) is a stylesheet language used for describing the presentation of a document written in a markup language. It is used to add style to web pages written in HTML and XHTML, but can also be applied to any kind of XML document, including SVG and XUL.
2. CSS allows you to control the layout and formatting of a web page, including colours, fonts, spacing, and more. With CSS, you can create a consistent look and feel across all pages on a website, and make global changes to the layout and design with minimal effort.
3. CSS uses a simple syntax, and can be written in a separate file with the CSS file extension, or included within the head section

of an HTML file. It provides a wide variety of styling options including layout, colours, fonts, effects and animations, responsive designs and many more.

4. CSS3, the latest version of CSS, introduces new features such as improved selectors, advanced layout control (flexbox, grid), and animation capabilities, while maintaining backward compatibility with earlier versions of CSS.

(4.2.3) JAVASCRIPT

JavaScript is a programming language that is primarily used to create interactive and dynamic websites. It allows you to add interactivity and other dynamic features to your web pages, such as form validation, creating pop-up windows, handling events like button clicks, and creating dynamic content.

JavaScript code can be written in a separate file with the JavaScript file extension, or included directly within the HTML file using a script tag. It is an interpreted language, which means that the code is executed directly by the browser, rather than being compiled in advance like some other languages.

JavaScript is a multi-paradigm language, which means it supports various programming styles, including object-oriented, functional, and imperative. It is also a prototype-based language, which allows for dynamic inheritance and the creation of objects through a process called cloning.

JavaScript can be used on both the front-end and back-end of a web application. Front-end JavaScript is executed in the browser, while back-end JavaScript (such as Nodejs) is executed on the server.

Some of the well-known libraries & frameworks like Query, Angular, ReactS and Vuejs are built using JavaScript.

6. CONCLUSION AND REFERENCE

CONCLUSION

Customer satisfaction towards online purchase of second-hand products with special reference to College Buddy is a study based on sampling survey. Primary data, the study was collected through structured questionnaires. The study led to the following conclusion. It reveals that the customers have a moderate level of satisfaction towards online purchase of second-hand goods through College Buddy. The age, gender and occupation of customer have no significant relation with their satisfaction level. Customers with graduation and above graduation tend to purchase more and so they are more satisfied. The Customers would interact with their seniors and form a bonding with the. Customers belong to urban area seems to be more satisfied than rural customers. Customers are cautious about the product as they inspect the product before and after purchasing. They think that shopping through College Buddy is superior compared to shopping through physical shops. Customers moderately sought advice from other consumers and the delivered product do often meet their expectations. And it also seems they are not that much confident to suggest College Buddy to others. It has

been observing that customers have eagerly tried and used new things in the market. But it is not economically viable to spend money on each and everything in the market. Therefore College Buddy opens an online platform to sell the old and used accessories. Both the customer and seller will get the economic benefits through this in a convenient way.
